

Make the product benefit playable.

A commercial, product and measurement case for Playable Factory

From first interaction to a measurable outcome

Fugo × Words of Wonders • Picnic × meal planning

Includes client strategy, a four-screen wireframe, a Ready product proposal, creative reviews, prospect research, two campaign reports and a reproducible evidence log.

RESEARCH CUT-OFF

03 October 2026

METHOD

Product research, first-hand gameplay review and reproducible campaign analysis. Supporting sources, calculations and the research workflow are included.

READOUT / NAVIGATION

A focused pilot, with explicit decision gates

The supplied campaigns are fictional clients. Their results are not attributed to Fugo or Picnic.

Commercial thesis

For Fugo, let a prospect experience a real word-solving payoff. For Picnic, demonstrate how a meal idea becomes a basket. The business objective changes from a qualified install to a first order.

What the data changes

Puzzle Game X: \$2.79 CPI overall, with Germany Android at \$5.10. Grocery App Y: \$7.96 first-order CPA; US is \$12.50 versus Türkiye at \$2.35. Investigate causes before reallocating spend.

Section	Pages / scope	Contents
1.1-1.4	3-9 • seven client-facing slides	Commercial strategy and four-screen wireframe
2.1-2.2 / 3.1-3.2	10 • one-page proposal / 11-14 • reviews	Product proposal and first-hand gameplay analysis
4.1 / 5.1	15 • banners / 16-20 • prospecting	Ten prospects; five gaming app-level UA records supported
5.2 / 5.3 / 5.4	21-22 • reports / 23 • workflow / 24 • AI log	Campaign analysis, API workflow and AI contribution
Research appendix	25 onward • methods, file register, sources	Includes original inputs as PDF attachments

Two audiences. One principle: show the value.

The playable should make the product easier to understand before asking for a conversion.

FUGO / Words of Wonders

Why this company

A word-connection game provides a compact, understandable interaction that can carry genuine product value into an ad.

Opportunity

One achievable word puzzle, followed by a visible discovery payoff, can help players self-select on the real experience.

Outcome

Install efficiency, guarded by first-session engagement and retained-player quality.

PICNIC / Netherlands

Why this company

Picnic's recipe experience links meal ideas to grocery ingredients. This is a practical benefit that a short interaction can demonstrate.

Opportunity

Turn "What's for dinner?" into a clear, satisfying basket-building moment.

Outcome

First completed order from a new customer in a serviceable area. Installs and sign-ups are intermediate steps.

Pilot proposition

Build one truthful core experience per brand. Compare against the client's current acquisition creative under equivalent delivery conditions; agree the business threshold before launch.

Different conversion goals need different promises

A successful interaction is useful only when it leads to the right customer action.

Decision	Fugo / gaming	Picnic / non-gaming
Audience hypothesis	People who enjoy short word puzzles; localize word difficulty and language by market.	Households planning meals within an eligible Dutch delivery area; validate channel targeting and service coverage.
Value demonstrated	Connect letters, solve a word, experience a small discovery.	Choose a meal and see its ingredients come together in a basket.
Primary conversion	Attributed new install; interpret alongside downstream player quality.	Attributed first completed order; distinguish first from returning customers.
Quality guardrails	Tutorial completion, D1/D7 retention and value per acquired player, when available.	Order contribution after incentives, cancellation/refund rate and repeat order, when available.
Avoid	A mechanic or reward that does not exist in the real game.	A simulated order confirmation, unsupported discount, delivery-time promise or assumed service eligibility.

Earn a pilot with a concrete, measurable brief

A proposed approach; no outreach has been sent.

Stage	Action and deliverable	Decision to advance
01 · Research	Verify app, product benefit, target markets and current creative. Map the budget owner and likely blockers.	A relevant benefit and a plausible business case.
02 · Open	Send a tailored concept thumbnail and one testable question. Fugo: authentic word discovery. Picnic: meal-to-basket understanding.	Sponsor agrees the problem is worth testing.
03 · Discover	Review baseline economics, audience, attribution, creative workflow, approvals and operational constraints.	Named primary metric, guardrails and data owner.
04 · Scope	Agree one mechanic, two controlled variants, destinations, production assets, iteration limits and commercial terms.	Written pilot brief and accountable approvers.
05 · Build and QA	Prototype, review claims, implement events, test success/idle/error paths and validate destination handoff.	Creative, technical and measurement sign-off.
06 · Launch and decide	Use an agreed test window and budget ceiling; read results by market/OS. Iterate, expand or stop against the brief.	A documented learning and next investment decision.

Change the buying process, not just the creative

Clarify who owns the result and who can block delivery.

Dimension	Fugo	Picnic
First contact / sponsor	Head of UA or Growth; involve a creative strategist early.	Head of Growth or Performance Marketing; involve country marketing.
Working team	UA, creative production, game/product owner and attribution/data lead.	Growth, brand, CRM/app product, analytics, legal and delivery operations.
Likely buying process	Creative test budget → rapid prototype → network QA → acquisition and player-quality review.	Business case → claim and brand review → service-area/destination validation → first-order economics review.
Likely objection	“This may win cheap installs but attract the wrong players.”	“A mini-game may distract from shopping or imply an unavailable service.”
Response	Keep the real mechanic and difficulty cue; compare acquired cohorts on agreed quality metrics.	Use a useful shopping interaction; keep eligibility and ordering in the real product; audit the claim chain.
Launch gate	Approved game assets, correct store IDs, event contract and OS/network QA.	Approved local copy, eligible geography, destination/deep-link fallback and first-order event definition.

Picnic: “Tonight’s dinner, basket sorted”

A proposed concept that demonstrates a product benefit rather than inventing a shopping capability.

OBJECTIVE

Increase first completed orders from new, eligible customers. Use basket understanding and CTA exposure as creative diagnostics.

AUDIENCE

Meal-planning households in Picnic’s Dutch service areas. Validate eligibility targeting, exclusions and language with the growth team.

KEY MESSAGE

“A dinner idea can become your grocery basket.” Demonstrate ingredients coming together; do not imply that playing submits an order.

Experience	Implementation intent
Hook	A meal card asks: “What’s for dinner?” A short visual cue points to its first ingredient.
Participation	Tap three highlighted ingredients. Each moves into the basket with visible progress: 1/3, 2/3, 3/3.
Payoff	The completed basket appears beside the meal. A concise message connects the action to meal planning in Picnic.
Handoff	An explicit “Explore Picnic” CTA opens the approved destination. Eligibility, registration and payment occur in the real app/site.

Four screens, one clear handoff

Low-fidelity interaction wireframe • proposed mobile portrait experience; not a screenshot of Picnic.

Recovery + measurement

Wrong tap: gentle cue, no penalty. Idle: repeat the visual hint. Log ready, first action, ingredient success, completion, CTA exposure and click. The close control is owned by the ad host.

Agree what would justify the next investment

A controlled pilot should distinguish comprehension, delivery and commercial outcomes.

Decision	Pilot specification
Test question	Does the meal-to-basket demonstration increase qualified first orders versus the current acquisition creative? For Fugo, use the equivalent real-mechanic discovery question.
Comparison	Keep audience eligibility, geography, OS, placements, destination and attribution window comparable. Randomize where supported; otherwise document delivery differences and limit causal claims.
Variant rule	After establishing the baseline comparison, vary one element at a time: benefit-led hook versus challenge-led hook, with the same core flow and CTA.
Primary and guardrails	Picnic: first-order CPA plus margin, cancellations and repeat order. Fugo: CPI plus retention and early engagement. Technical load/error rates guard both.
Analysis agreement	Before launch, agree baseline rate, commercially meaningful effect, sample need, test duration, spend ceiling and stopping rules. Do not select a winner from repeated unplanned peeks.
Decision	Expand only when the commercial threshold and quality guardrails are met. Diagnose a failure by delivery, interaction and downstream handoff; stop if product truth or economics do not hold.

2.1-2.2 / ONE-PAGE PRODUCT PROPOSAL

Ready: turn a creative variant into a launchable test

Proposal: a goal-aware launch checklist and versioned experiment brief.

Problem to validate

Ready already supports template customization and variant testing. The opportunity is a structured handoff between creative production, QA and the business metric—not basic editing or A/B duplication.

Proposed workflow

Choose goal → map events → validate paths and destination → export a versioned experiment brief. Show measurement completeness before the team approves launch.

Design area	MVP behavior / acceptance condition
Goal-aware setup	Gaming: install with retained-player guardrail. Grocery: first order with contribution/repeat-order guardrails. Offer defaults, but require owners to approve the definitions.
Event contract	Store creative version, experiment ID, goal, market/OS, destination, schema version and measurement status. Use session-scoped event IDs and an explicit deduplication policy.
QA + handoff	Exercise ready, first action, success, idle, wrong input, CTA exposure/click and destination fallback. Preserve the configuration snapshot. Warn when downstream attribution cannot be joined.
Scope and validation	Start with selected templates and manual results import. Exclude automatic budget allocation and universal MMP integration. Compare setup time, tracking defects and usable event coverage against today’s process.
Adoption and risk	Progressive defaults reduce form fatigue; advanced settings stay optional. PM owns the brief, creative owns flow, analytics owns definitions. Public pages do not prove the feature is absent; validate before building.

3.1 / EVIDENCE-BASED CREATIVE REVIEW

Squad Busters: make each action serve the outcome

My playthrough observations and screenshots inform three proposed improvements.

PLAYTHROUGH FRAME

Unmodified image; shown for art style and visible interface. No timing or audio inferred.

Observed flow. A boss preview introduces a linear route. Drag to move; stop to shoot enemies in range. Coins open two chests, each offering only the same character: the first adds a duplicate, the second produces three units that fuse. Defeat the boss and collect all coins to finish. Hits cause no effective player damage, and falling is disabled; emeralds currently give the same value as coins.

Visual / design assessment. I found this the most polished of the three. Frames show saturated 3D scenery, blue range/red combat states, locked character alternatives, a fusion payoff and a branded PLAY end card. Combat lacks a functional damage-and-survival consequence.

Exactly three changes	Rationale / validation
01 · Add readable stakes make player health functional and add a losing condition. Test a forgiving health bar, clearly telegraphed damage and a short retry; preserve enough time to reach the fusion payoff.	Health and failure make positioning meaningful. Guard against lower payoff reach or frustration; measure failure, retry and completion.
02 · Differentiate emerald value each emerald is worth two coins, versus one for a coin. Show +2 feedback and rebalance chest prices/drop counts so the scripted route still works.	Different visual rewards should have a legible distinction. Test chest-opening time and stalled progression; this is a proposed economy change.
03 · Clarify the chest action replace the apparent character selection with a clear recruit/fuse confirmation when only one character is selectable. Show 1/3 → 2/3 → fusion.	Avoid presenting a predetermined action as a choice. Measure chest dwell time, invalid taps and fusion reach.

3.1 / EVIDENCE-BASED CREATIVE REVIEW

Clean It!: make each action serve the outcome

My playthrough observations and screenshots inform three proposed improvements.

PLAYTHROUGH FRAME

Unmodified image; shown for art style and visible interface. No timing or audio inferred.

Observed flow. Phase 1 uses drag movement to vacuum dirt and small floor litter; roughly 20% coverage advances the mission. Phase 2 collects replenishing table trash. Each collected item leaves the counter after ten seconds, so four recent pickups trigger victory. Dumping into side containers is optional, and waiting customers do not affect the objective.

Visual / design assessment. Frames show a stylized 3D restaurant, clear cleaning contrast, mission instructions, a pickup counter, disposal animation and a DOWNLOAD NOW end card. My priority is to align victory with the existing disposal mechanic.

Exactly three changes	Rationale / validation
01 · Complete the disposal loop remove pickup expiry, allow unrestricted collection during this short ad, and win after four pieces are deposited. Track carried trash separately from deposited progress (0/4).	Makes disposal necessary and removes arbitrary decay. Atomically transfer carried items on deposit, count each once and trigger victory once at ≥ 4 deposited.
02 · Match the first goal to its threshold show a bounded starter zone and a meter labeled for that zone. Retain the existing mission prompts and completion feedback, but align the visible area with the actual threshold.	Finishing after only about one-fifth of a visibly dirty room can make progress ambiguous. Measure transition comprehension and first valid phase-2 action.
03 · Remove competing customer cues reduce or remove angry-customer animation during the cleaning trial; keep a clear route from tables to bins and a concise disposal cue.	The queue currently implies an unrelated service task. Test wrong-destination movement, time to first deposit and end-card reach.

3.1 / EVIDENCE-BASED CREATIVE REVIEW

All in Hole: make each action serve the outcome

My playthrough observations and screenshots inform three proposed improvements.

PLAYTHROUGH FRAME

Unmodified image; shown for art style and visible interface. No timing or audio inferred.

Observed flow. Choose one of two heart-hole avatars, then collect the collection targets in 15 seconds: 100 croissants, 50 cupcakes, 10 strawberry cakes and one watermelon. Objects form outward rings; collection triggers three growth stages. An alarm and red flash begin after five seconds. Green/red circles communicate the result; any tap on the non-playable ending map opens the store.

Visual / design assessment. Frames confirm avatar choice, radial food placement, counters, “Gulp them all!” copy, red warning overlay, plain result circles and an ending scene without a labeled CTA. I found the alarm frightening and too early; the ending provides no clear instruction for the store handoff.

Exactly three changes	Rationale / validation
01 · Make the ending an explicit choice replace the circles alone with a readable outcome, game name and labeled Play now button. Remove background-tap store redirection; use a stable end-card composition after either result.	A click should express intent. Measure CTA exposure, explicit clicks and downstream quality; a fall in accidental clicks can be a positive outcome.
02 · Reserve urgency for the final seconds replace the early alarm with a restrained cue near the end (test the last three seconds), reduce red flashing and offer a silent treatment.	The alarm occupies most of the 15-second trial and felt frightening to me. Compare completion and exits; urgency should not obscure the reward.
03 · Teach the objective before pressure add one short drag cue, readable target labels and clear growth feedback. Start the timer on the first valid move; tune quotas/time using completion evidence.	My finishes with 1–4 seconds remaining suggest testing whether the timer allows enough time to learn. Measure first-action time, target shortfalls and completion by device.

3.2 / NON-GAME ADAPTATION

Picnic: collect the ingredients for dinner

Five-step adaptation of the collection-and-growth loop from my All in Hole playthrough.

Step	Adapted flow	Feedback / event
1 · Set the goal	Show one recipe and three required ingredients. Ask the viewer to “Collect tonight’s ingredients.”	Goal shown; no price or delivery claim.
2 · Teach movement	Move a shopping basket toward the first highlighted ingredient using one simple drag gesture.	First valid movement and first collection.
3 · Complete the list	Collect the remaining ingredients; ignore unrelated items with a gentle visual cue and no penalty.	Target-list progress; failed collection attempts.
4 · Show the benefit	Reveal the meal beside the completed basket: the ingredients belong together for this dinner idea.	Goal completion and payoff exposure.
5 · Hand off	Show “Explore Picnic.” Open the approved app/site destination on an explicit tap; ordering happens there.	CTA exposure, click and destination result.

Kept

Direct drag movement, item collection, goal counters and increasing collection capacity; use restrained basket growth as feedback.

Changed

Heart-hole → basket; high quotas → three recipe ingredients; remove alarm/forced timer. Explicit CTA replaces any-tap redirection; no simulated order.

4.1 / TEXT-ONLY BANNER CONCEPTS

Three concepts built for display advertising

Static or automatically animated banners. None requires gameplay or interactive input.

Brand / objective	Creative treatment and copy	Format, handoff and test
Fugo / Words of Wonders Qualified installs	One word opens a discovery. Letters automatically form a word; a small landmark silhouette resolves behind it. Headline: “One word. A new discovery.” CTA: “Play now”	Short automatic animation; static fallback shows the resolved word and landmark. End state stays legible. Test discovery framing against straightforward word-challenge copy; inspect CPI and acquired-player quality.
Picnic / grocery First orders	Dinner becomes a basket. A meal image transitions to its ingredients arranged together in a grocery basket. Headline: “Dinner ideas. Groceries together.” CTA: “Explore Picnic”	Automatic transition, no tapping required. Destination checks service availability and presents the real product. Test meal-led versus basket-led first frame, keeping audience and destination comparable.
Everli / grocery First orders	A shopper understands the plan. Two static panels show produce for “tonight” and “later this week,” with a shopper cue. Headline: “Groceries picked with your plans in mind.” CTA: “Shop with Everli”	Static display or simple two-state animation. Validate that any depicted preference can be honored in the chosen market. Test shopper-led service framing versus product-only imagery.

5.1 / PROSPECTING METHOD

Qualification starts with evidence, not popularity

Narrow non-gaming vertical: app-based online grocery shopping and home delivery in Europe.

Gaming gate

Casual/puzzle app + correct studio identity + independent/mid-size screen + dated US/European ad activity. Downloads, store updates and UA job posts do not meet the activity test.

Five candidates have recent app-level ad evidence. Cypher replaces Fugo only in this prospect list; Task 1 keeps Fugo.

Why this grocery vertical

A shared acquisition journey—understand the service, confirm coverage, register and place a first order—supports repeatable creative and measurement work.

Country operations, stock, delivery capacity and incentive economics still require local discovery.

Evidence level	Interpretation / action
Identity and scale	Official sites and store publishers establish app identity. LinkedIn size bands are self-reported and can conflict with associated employee counts; they are not audited headcount or proof of ownership.
UA evidence	SocialPeta pages report observed activity, not complete media plans or verified spend. Past-30-day ad-country mix plus recent sightings supports a lead; a US store page alone does not.
Sales readiness	Verify the actual budget owner, current parent structure and agency/publisher relationship before outreach. Leap’s app has ad evidence but mixed advertiser labels need resolution.
Exclusions	Lessmore is excluded after its sale to Miniclip. Large-publisher subsidiaries are not substitutes for the requested studio segment.

5.1 / GAMING PROSPECTS 1-3

Prioritize leads with a visible acquisition signal

Links below identify the company, app and ad evidence. Roles are proposed first contacts; no individual has been contacted.

Grand Games

Magic Sort: Water Color Puzzle
Profile size: 51–200

Fit. A single color-sorting decision can demonstrate the genuine puzzle payoff; propose a controlled opening-difficulty test.

First contact: Head of UA / Growth

UA. US and Germany in the past-30-day observed ad mix; last observed 28 Sep 2026. App Store ID 6499209744.

[Website](#) · [Company LinkedIn](#) · [Ad evidence](#)

Rooftop Games

People Connector
Profile size: 2–10

Fit. A short visual grouping puzzle offers a clear first success; test clue clarity without replacing the actual mechanic.

First contact: Founder / Growth owner

UA. US and France in the past-30-day ad mix; last observed 29 Sep 2026. Package com.game.people.connector.

[Website](#) · [Company LinkedIn](#) · [Ad evidence](#)

Leap Games

Search It - Hidden Objects
Profile size: 2–10

Fit. A compact scene can teach the hidden-object loop immediately; test target visibility and search density.

First contact: Founder / Head of Growth

UA. US in past-30-day ad mix; creative seen 30 Sep 2026. Some advertiser labels say Fugo Games SA; confirm buying entity.

[Website](#) · [Company LinkedIn](#) · [Ad evidence](#)

Rooftop's website URL is corroborated by its store/profile; the website page itself did not retrieve in this run. Public scale/ownership screening is preliminary, not a cap-table audit.

5.1 / GAMING PROSPECTS 4-5

Two more studios with dated acquisition signals

Cypher closes the fifth prospect slot; Fugo remains the selected gaming brand in Task 1.

INFINITY GAMES / Enigmatic: Crime Puzzle Cases

Fit: clue-based deduction can become a short, truthful “one clue, one decision” playable. Public LinkedIn size band: 11–50.

Recent UA: SocialPeta’s past-30-day observed ad-country mix includes Germany, UK and US; aggregate last observed 28 Sep 2026, with an individual sample dated 01 Oct. Google Play identifies Infinity Games, Lda as publisher.

First contact: Head of Growth / UA; founder if the role is combined.

[Website](#) · [Company LinkedIn](#) · [App](#) · [Ad evidence](#)

CYPHER GAMES / Royal Smash! - Physics Puzzle

Fit: a short aim-and-chain-reaction interaction can demonstrate the real physics-puzzle payoff. The company profile reports 51–200 employees and private ownership; its official site and store listing agree on the game identity.

Recent UA: SocialPeta reports US and Netherlands in the past-30-day observed ad-country mix; aggregate last observed 28 Sep 2026 and an individual playable sample on 29 Sep.

First contact: Head of UA / Growth; propose testing shot readability and payoff timing against the existing acquisition creative.

[Website](#) · [Company LinkedIn](#) · [App](#) · [Ad evidence](#)

Fugo searches did not establish recent US/European UA. Replacing only the Task 5.1 prospect preserves the user-approved Fugo + Picnic strategy while meeting the evidence requirement.

5.1 / GROCERY PROSPECTS 1-3

Make a useful shopping benefit visible

All three have a consumer grocery app. Proposed market scope is narrower than corporate footprint.

Picnic

Picnic • Netherlands

Recipe-to-basket benefit can explain a practical reason to try the service. Optimize for first order after eligibility, not installs alone.

First contact

Head of Growth / Performance Marketing

[Website / product source](#) · [App](#) · [Company LinkedIn](#)

Ocado Retail

Ocado Online Grocery • UK

Demonstrate building a useful weekly basket. Test shopping convenience while keeping delivery-slot and pricing claims tied to current local conditions.

First contact

Head of Customer Acquisition / Growth

[Website / product source](#) · [App](#) · [Company LinkedIn](#)

Everli

Everli • Italy

Show the value of a shopper-assisted grocery journey. Validate any produce preference or substitution behavior before making it central to the creative.

First contact

Head of Growth / Performance Marketing

[Website / product source](#) · [App](#) · [Company LinkedIn](#)

5.1 / GROCERY PROSPECTS 4-5

Qualify operational readiness before buying volume

Count the company group once; tailor the concept to the local consumer brand.

ROHLIK GROUP / Knuspr — Germany

Fit: a recipe or meal-mission interaction can connect product discovery with a useful basket. Use Knuspr's local app and approved assortment story; avoid counting other Rohlik brands as extra prospects.

First contact: Group Head of Growth, with the Germany acquisition owner for pilot execution.

Discovery gate: local delivery coverage, destination behavior, new-customer definition and first-order contribution.

[Company website / brand source](#) · [Knuspr app](#) · [Company LinkedIn](#)

FLINK / Flink — Germany pilot

Fit: a short “missing ingredients for tonight” interaction can demonstrate convenience. Keep the proposition grounded in available assortment and actual delivery coverage.

First contact: Head of Growth / Performance Marketing.

Discovery gate: acquisition exclusions, local capacity and order economics. Do not turn speed-oriented branding into an unverified delivery-time guarantee.

[Company website](#) · [Flink app](#) · [Company LinkedIn](#)

Qualification outcome: five distinct app-owning grocery companies within one European vertical. This is a fit shortlist; it is not evidence of budget, purchase intent or a current Playable Factory relationship.

5.2 / ONE-PAGE CLIENT REPORT

Puzzle Game X: repair Germany Android before expansion

Descriptive campaign analysis • all spend in USD • campaign dates and attribution window were not supplied.

SPEND	INSTALLS	CPI	INSTALLS / 1,000
\$20,000	7,160	\$2.79	6.60

Market / OS	Installs	CPI \$	CPM \$	Load %	Interact %	End %	CTR %
US / iOS	3,050	2.75	20.00	93.10	67.01	56.49	5.19
US / Android	2,390	2.55	16.05	91.84	62.75	53.88	4.50
DE / iOS	1,210	2.40	19.33	94.00	68.79	59.79	6.20
DE / Android	510	5.10	19.26	87.41	51.69	47.54	3.04

Diagnosis. Germany Android CPI is 2.13× Germany iOS despite similar CPM (\$19.26 vs \$19.33). Lower load and interaction rates, then weaker completion, indicate multiple points to investigate. US Android is cheaper than US iOS (\$2.55 vs \$2.75); an OS-wide rule would mislead.

Three actions

- 1. Audit Germany Android loading, device/network mix and the opening interaction before adding spend.
- 2. Run bounded expansion tests in Germany iOS and US Android; compare marginal CPI and retained-player quality.
- 3. Instrument first-success time, wrong inputs, step exits and CTA exposure; join to tutorial/retention separately.

Metric choices

Cost + volume lead; CPM, yield and funnel rates diagnose. Omit ROAS/profit (no revenue), aggregate time (unknown base) and CPC (not the business outcome). Counts may not be unique or cohort-matched.

Denominators: load/impressions; first interactions/loads; end cards/interactions; CTA clicks/impressions. Historical efficiency is not a forecast or causal proof.

5.2 / ONE-PAGE CLIENT REPORT

Grocery App Y: validate economics before shifting markets

Descriptive campaign analysis • all spend in USD • campaign dates and attribution window were not supplied.

SPEND	FIRST ORDERS	FIRST-ORDER CPA	ORDERS / 1,000
\$14,400	1,810	\$7.96	2.38

Market / OS	First orders	CPA \$	CPM \$	Load %	Interact %	End %	CTR %
US / iOS	640	11.25	24.00	94.00	56.03	44.94	2.97
US / Android	360	14.72	20.38	91.54	50.84	40.50	2.15
TR / iOS	520	1.73	10.00	95.56	70.93	62.30	6.89
TR / Android	290	3.45	9.09	87.27	60.42	51.72	4.36

Diagnosis. US accounts for 86.81% of spend and 55.25% of orders; CPA is \$12.50 versus \$2.35 in Türkiye. Both CPM (\$22.32 vs \$9.50) and order yield (1.79 vs 4.05 per 1,000) differ. Türkiye Android click-to-order is 6.04%, below US Android’s 6.43%.

Three actions

- 1. Validate contribution, repeat orders and delivery capacity before a bounded Türkiye iOS expansion test.
- 2. Diagnose US Android: simplify the benefit demonstration and inspect eligibility, sign-up and checkout handoff separately.
- 3. Add first-success time, step exits, wrong inputs and CTA exposure; connect creative cohorts to first/repeat orders.

Metric choices

Cost + volume lead; CPM, yield and funnel rates diagnose. Omit ROAS/profit (no revenue), aggregate time (unknown base) and CPC (not the business outcome). Counts may not be unique or cohort-matched.

Denominators: load/impressions; first interactions/loads; end cards/interactions; CTA clicks/impressions. Historical efficiency is not a forecast or causal proof.

5.3 / HALF-PAGE WORKFLOW

Repeatable prospecting with Sensor Tower + AI

Designed workflow under the brief's API-access assumption; no Sensor Tower API was called.

1 • Retrieve. On a scheduled run, use the licensed API's documented fields to filter casual/puzzle apps by target markets, an explicit download range and dated ad activity in the trailing 90 days. Save app/store IDs, publisher, genre, country, period, download estimate, ad observation dates/channels and source timestamp. If country-level ad evidence is unavailable, return "unqualified," not an inferred market.

2 • Resolve. Prompt: "For each app ID, match the store publisher to its official website and company LinkedIn. Return supporting URLs, parent company, confidence and unresolved conflicts; never invent a slug." Deduplicate subsidiaries at the chosen buying-entity level.

3 • Identify roles. Prompt: "Find current public evidence for the Head of UA/Growth or founder at these verified companies. Return name, role, company, source URL and verification date; leave unknowns blank." Recheck employment and route to human review before outreach.

4 • QA and operate. Validate app-publisher-domain agreement, dated market-specific ads, current parent structure and size. Store reason codes, provenance and last-checked date; rerun stale leads and manually audit a sample. Handle pagination, rate limits and retry/idempotency. Estimates, incomplete ad coverage, stale profiles and mistaken identities are known risks; do not scrape private contact data or automate sending.

The workflow description occupies approximately half of this page. Operational implementation and API licensing are outside this case.

5.4 / ONE-PAGE AI LOG

My workflow and the division of labor

I led the research direction, interpretation and final review; AI supported research, analysis and production.

Research design. I created the research tree, defined the scope and organization of the source files, and selected the companies and transferable features. I read and analyzed the gathered evidence, played the three ads and developed the creative insights from my game experience and industry understanding.

Workstream	AI contribution	My contribution
Research	GPT 5.6 Sol mainly supported web-data gathering and summarization. GPT Astra also researched and completed source files.	I defined the questions, selected the companies and features, and interpreted the findings.
Product and creative	AI organized the proposals, developed technical detail and drafted language from my insights.	I supplied the product reasoning, gameplay observations and creative direction, and reviewed the recommendations.
Campaign analysis	AI-assisted Python recalculation reconciled eight source rows and 18 derived rows; ratios were checked against the supplied metrics.	I interpreted the commercial implications and finalized the investigation and testing priorities.
Report production	GPT Astra 6 at medium-to-high usage supported structure, visuals, report writing and live revisions. AI also supported source packaging and rendered-layout checks.	I reviewed each stage, shaped the final narrative and finalized the report and manual intervention logs.

Workflow development. I first used NotebookLM as a source database connected to Claude Cowork to reduce context overhead. The summaries lacked the detail needed for this case, so I discarded that report and worked directly from the source files with Astra. Direct source access became the basis for the final analysis.

Ownership. I initiated, approved and finalized the manual intervention logs. Their first-person wording, like the report, was prepared with AI assistance. I retained responsibility for the insights, judgments, review and finalization.

RESEARCH APPENDIX / WORKFLOW LOG

From research questions to a traceable report

Research and production completed across 02–03 October 2026.

Stage	Work performed	Output / verification
01 · Frame	I designed the research tree and source-file requirements around the case brief, deliverables and page limits.	A structured source collection and a report organized around the required tasks.
02 · Gather	AI assisted web research, source-file completion and summaries. Official product/company pages, app stores, company profiles and ad observations were examined.	Product facts and prospect records tied to identifiable sources and access dates.
03 · Interpret	I analyzed the research, selected transferable benefits, played the ads and documented mechanics, timing and my assessment.	Commercial concepts and three gameplay reviews grounded in my descriptions and screenshots.
04 · Calculate	The raw campaign table was reconciled; Python regenerated segment and aggregate metrics from underlying counts.	Eight raw observations and 18 derived rows reconcile. Denominators, missing economics and inference limits are explicit.
05 · Produce	AI assisted report structure, technical wording, vector wireframes and screenshot selection. I reviewed the content and creative recommendations.	A client-facing strategy, product proposal, creative reviews, prospect list and campaign reports.
06 · Verify and package	Source hashes, attachments and calculation outputs were assembled. Rendered pages and wording were checked for layout and consistency.	A complete report with a source register, external evidence ledger, arithmetic appendix and matching context files.

RESEARCH APPENDIX / SUPPLIED SOURCE REGISTER

Original inputs · 1-12 of 50

All 50 source records are embedded as PDF attachments. Original input bytes are preserved; use a PDF reader’s Attachments panel.

ID / exact filename	Use in this report	SHA-256 prefix
F01 · 01-recalculate.py	Recalculation code; executed on a working copy.	cadd19d8ed3f

RESEARCH APPENDIX / ARITHMETIC 1

Definitions and reconciliation controls

All derived ratios use sums of numerators and denominators. Display rounding occurs only at the final step.

Measure	Formula	Interpretation / limitation
CPI / first-order CPA	Spend ÷ conversions	Puzzle conversions = installs. Grocery conversions = first orders.
CPM / outcome yield	1,000 × spend ÷ impressions 1,000 × conversions ÷ impressions	Separates media cost from outcomes per exposure; IPM applies to the puzzle only.
Load / interaction rates	Loads ÷ impressions First interactions ÷ loads	Entry diagnostics; counting definitions and device/network composition are unknown.
End-card reach / CTR	End cards ÷ first interactions CTA clicks ÷ impressions	End-card rate is among interactors. CTR uses impressions, not end-card views.
Conversion per click	Conversions ÷ CTA clicks	Descriptive downstream ratio; not necessarily a matched click-through conversion probability.
Time and omitted economics	No aggregated average time; no ROAS/profit	The time metric’s denominator is unspecified. Revenue, retention, margin, dates and targets are absent.

Control totals

Puzzle: \$20,000 / 7,160 = \$2.793296 CPI. Grocery: \$14,400 / 1,810 = \$7.955801 first-order CPA. Eight raw rows and 18 derived segment/aggregate rows reconcile with the supplied metric file.

RESEARCH APPENDIX / ARITHMETIC 2

Raw observations, preserved without inferred cohorts

The two-page source PDF splits eight rows across columns. It does not contain two independent samples.

Campaign / cell	Spend \$	Impr.	Loads	1st interact.	End cards	CTA clicks	Conv.	Avg sec.
Puzzle / US / iOS	8,400	420,000	391,000	262,000	148,000	21,800	3,050	24
Puzzle / US / Android	6,100	380,000	349,000	219,000	118,000	17,100	2,390	21
Puzzle / DE / iOS	2,900	150,000	141,000	97,000	58,000	9,300	1,210	27
Puzzle / DE / Android	2,600	135,000	118,000	61,000	29,000	4,100	510	16
Grocery / US / iOS	7,200	300,000	282,000	158,000	71,000	8,900	640	18
Grocery / US / Android	5,300	260,000	238,000	121,000	49,000	5,600	360	15
Grocery / TR / iOS	900	90,000	86,000	61,000	38,000	6,200	520	29
Grocery / TR / Android	1,000	110,000	96,000	58,000	30,000	4,800	290	22

Why the geographic gap is not a causal result. Auction prices, audience composition, operating-system mix, placement quality, creative versions, eligibility and attribution rules may differ. None is supplied as a control variable. The data prioritizes investigation and bounded tests; it does not identify a single root cause or justify unlimited reallocation.

RESEARCH APPENDIX / ARITHMETIC 3

Full diagnostic rates for each campaign cell

Percentages below preserve denominator consistency; total rates are recomputed from total counts.

Campaign / cell	Cost / conv. \$	Load %	Interact %	End %	CTR %	Conv./click %	Conv./1k
Puzzle / US / iOS	2.75	93.10	67.01	56.49	5.19	13.99	7.26
Puzzle / US / Android	2.55	91.84	62.75	53.88	4.50	13.98	6.29
Puzzle / DE / iOS	2.40	94.00	68.79	59.79	6.20	13.01	8.07
Puzzle / DE / Android	5.10	87.41	51.69	47.54	3.04	12.44	3.78
Puzzle / TOTAL	2.79	92.07	63.96	55.24	4.82	13.69	6.60
Grocery / US / iOS	11.25	94.00	56.03	44.94	2.97	7.19	2.13
Grocery / US / Android	14.72	91.54	50.84	40.50	2.15	6.43	1.38
Grocery / TR / iOS	1.73	95.56	70.93	62.30	6.89	8.39	5.78
Grocery / TR / Android	3.45	87.27	60.42	51.72	4.36	6.04	2.64
Grocery / TOTAL	7.96	92.37	56.70	47.24	3.36	7.10	2.38

Interpretation guardrails: US Android puzzle CPI is below US iOS. Türkiye Android grocery conversion/click is below US Android. Neither an “iOS always wins” rule nor a “Türkiye wins every funnel stage” claim is supported.

3.1 / SUPPORTING SCREENSHOT EVIDENCE

Squad Busters — selected start-to-end frames

Screenshots from my playthrough. Selection highlights evidence relevant to the recommendations.

Start: drag instruction and blue range.

Chest: one available character; alternatives locked.

Fusion: clear power-up feedback.

End: game identity and explicit PLAY button.

My recommendation adds functional damage, visible health and a losing condition so positioning affects survival.

3.1 / SUPPORTING SCREENSHOT EVIDENCE

Clean It! — selected start-to-end frames

Screenshots from my playthrough. Selection highlights evidence relevant to the recommendations.

Start: explicit “Clean the area!” instruction.

Transition: completion while much of the floor remains dirty.

Disposal: existing action that the win condition need not use.

End: clear **DOWNLOAD NOW** button.

My recommendation makes disposal the winning condition: collect trash, carry it to a container and deposit four pieces to finish.

3.1 / SUPPORTING SCREENSHOT EVIDENCE

All in Hole — selected start-to-end frames

Screenshots from my playthrough. Selection highlights evidence relevant to the recommendations.

Start: avatar choice, targets and timer.

Warning: full red overlay; five seconds shown remaining.

Result: plain green circle without explanatory copy.

Ending scene: no labeled store CTA visible.

The warning begins five seconds into the trial. I recommend a softer cue in the final three seconds and a readable outcome with an explicit Play now button.
